

FAQ

# Can I change the message posting limit?

We have created the limits with a lot of testing, so we recommend that you don't change these, but if you want to, we give you an option to do so.

```
60 client.send_message(market_groups[i], message)
61 time.sleep(25) # Time Gap After Sending message to one group
```

On line 61, you will see the "time.sleep(25)".so here, 25 means that message will be sent to all the groups one by one with 25 seconds interval. You can increase or decrease the limit by changing this value.

```
82     print('Message Sent To All Groups!')
83     time.sleep(3600) # Time-Gap for Sendig Whole Message to All Groups!
```

Now on line 83, you will see "time.sleep(3600)," so here, 3600 means that after 3600 seconds (1 hour), the message cycle will again re-start & the message will start posting again in the groups. You can increase or decrease the limit by changing this value.

# How to run multiple accounts?

---

To run multiple accounts, you need to upload the files (group joining & ad bot script) multiple times and use different accounts in each script.

# How many accounts can I run with a \$5 Server Package?

---

You can easily run 5-10 accounts at the same time. If you want to run more accounts, you can get the higher package, but in starting, the \$5 package is sufficient.

# Why should I close the Console Before running another script?

---

In the setup guide, you saw that you need to close the Console first before running another script because Telegram doesn't allow two actions simultaneously. So make sure that you close one action before running another.

For Ex: Once you run the joining script after it's done, close its Console and then start the Adbot message script.

# How to contact you?

---

You can message me on Telegram @ninja101

Make sure to check the username before contacting as there are many fake accounts too.
